Exp 7 Zoho Creator API Integration

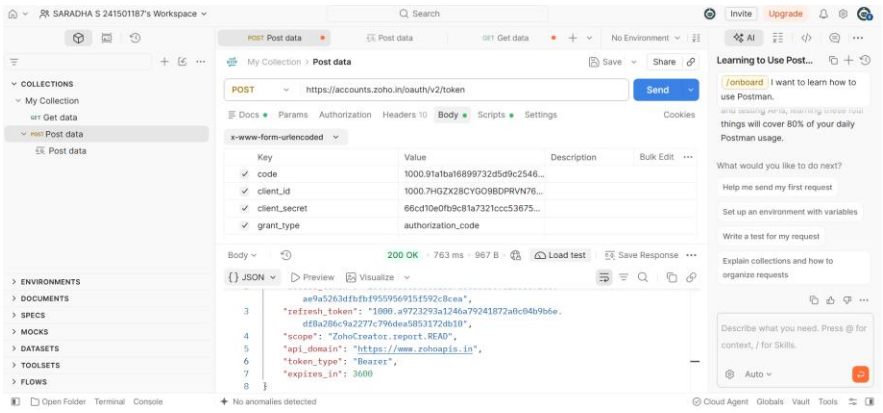

Aim:

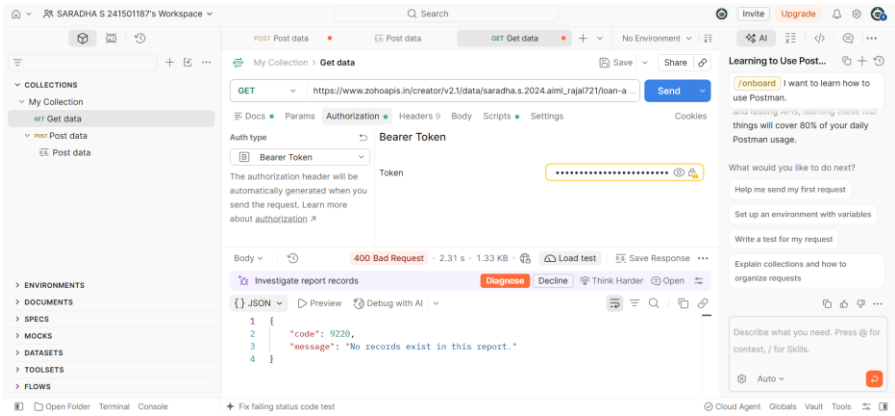

To study OAuth authentication and test a GET request to retrieve loan application records from Zoho Creator using Postman.

Procedure:

1. Open the Zoho API Console.
2. Select Self Client and configure the ZohoCreator.report.READ scope.
3. Generate an authorization code.
4. Exchange the authorization code for an access token using a POST request in Postman.
5. Create a GET request using the Creator API endpoint and report link name All_Loan_Applications.
6. Select Bearer Token authorization and enter the access token.
7. Send the request and observe the response.

Result:

OAuth token generation and GET request testing were performed. Successful retrieval of records was not verified because the API response indicated that no records existed in the selected report.
