Experiment 10 — Performance Optimization in Zoho Creator

Aim

To study techniques used to improve the performance and responsiveness of applications developed using Zoho Creator.

Theory

Performance optimization is the process of improving an application's speed, responsiveness and efficient use of resources.

Techniques for performance optimization

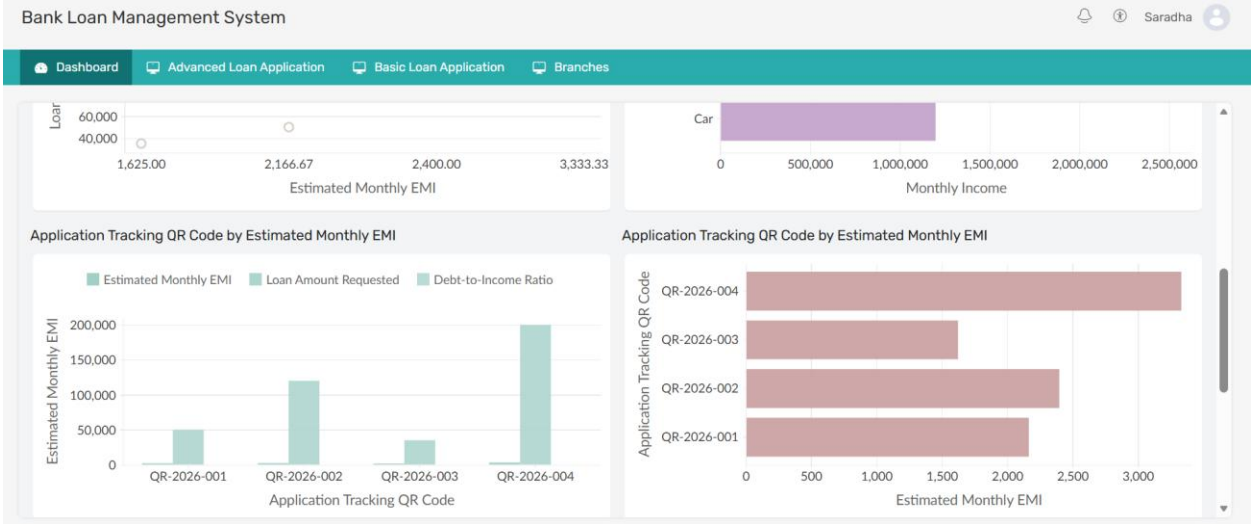

1. Optimize Deluge scripts: Avoid unnecessary calculations and repeated operations.
2. Reduce unnecessary data retrieval: Retrieve only the records and fields needed.
3. Optimize reports: Use suitable filters and avoid displaying unnecessary columns.
4. Improve page design: Avoid excessive components and complicated layouts.
5. Optimize workflows: Avoid unnecessary workflow triggers and repeated actions.
6. Use efficient searches: Apply appropriate criteria when retrieving records.
7. Monitor performance: Test important forms, reports and workflows to identify delays.
8. Avoid duplicate processing: Prevent the same operation from running unnecessarily.

Benefits

- Faster page loading.
- Improved user experience.
- Reduced unnecessary processing.
- Better scalability as records increase.
- More efficient application maintenance.

Application to the loan system

For the Loan Application & Pre-Screening Management application, reports can be filtered by application status or branch. Deluge scripts should perform only necessary operations, and workflows should avoid repeated processing.

Result

The major techniques and benefits of performance optimization in Zoho Creator were studied.
