Experiment 11 — Application Deployment and Migration

Aim

To study the deployment and migration of applications developed using Zoho Creator.

Theory

Application deployment is the process of making an application available to its intended users. Migration involves moving an application or its components between environments or accounts.

Deployment process

1. Develop the application in the development environment.
2. Test forms, reports, workflows and permissions.
3. Identify and fix errors.
4. Prepare the application for release.
5. Deploy or publish the application using the supported Creator options.
6. Verify that the application works correctly in the target environment.
7. Monitor the deployed application.

Migration considerations

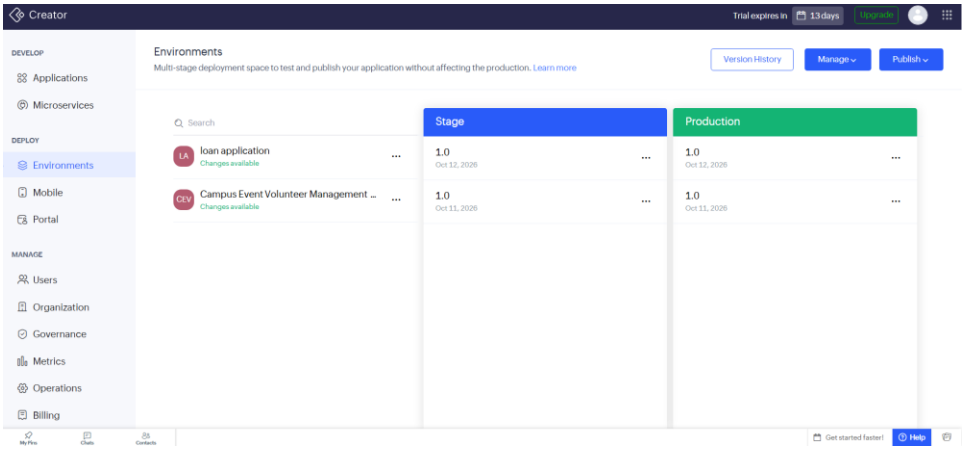

- Application components must be compatible with the target environment.
- Data may require separate migration or validation.
- Connections and integration settings may need reconfiguration.
- User permissions must be checked.
- Backups should be maintained before significant changes.

Example

The loan application system may be developed and tested in a development environment before being released to loan officers and branch managers.

Benefits

- Controlled releases.
- Easier testing before production.
- Reduced deployment errors.
- Better maintenance and version management.

Result

The concepts and steps involved in application deployment and migration in Zoho Creator were studied.
