Experiment 12 — Security and Governance in Zoho Creator

Type: Theory only — no screenshots required

Aim

To study security mechanisms and governance practices used to protect applications and data in Zoho Creator.

Theory

Security protects application data and prevents unauthorized access. Governance establishes rules and procedures for managing application development, access, changes and compliance.

Security measures

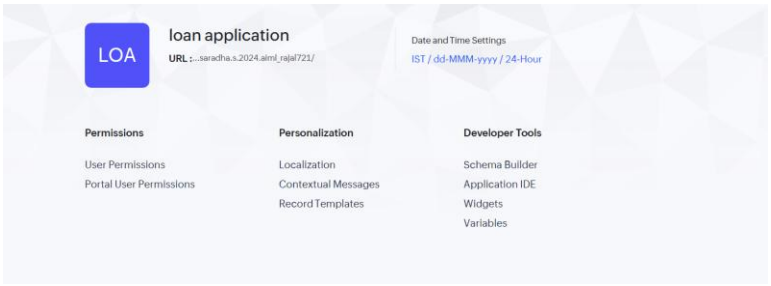

1. Authentication: Verifies the identity of users.
2. Authorization: Controls the actions users can perform.
3. Role-based permissions: Assigns access based on job responsibilities.
4. Data protection: Prevents unauthorized disclosure of confidential information.
5. API security: Uses OAuth tokens and appropriate scopes for API access.
6. Secure credential handling: Keeps passwords, tokens and secrets private.
7. Audit and monitoring: Reviews relevant activity and changes where supported.
8. Backup and recovery: Helps restore information after accidental loss or failure.

Governance practices

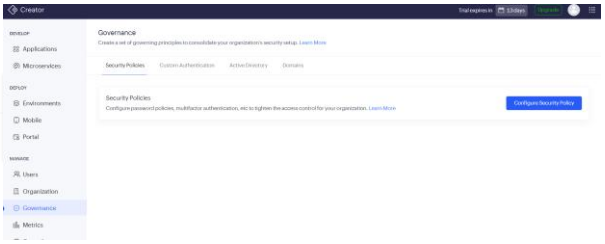

- Define application ownership and responsibilities.
- Follow naming conventions and documentation standards.
- Review permissions periodically.
- Test changes before deployment.
- Maintain backups and change records.
- Follow applicable data protection policies.

Application to the loan system

Loan records may contain applicant names, email addresses, income details and financial information. Only authorized users should access this information according to their responsibilities.

Result

Security principles and governance practices for Zoho Creator applications were studied.
