Experiment 8 — User Management and Role-Based Access Control

Aim

To study user management and role-based access control in Zoho Creator for a loan application management system.

Theory

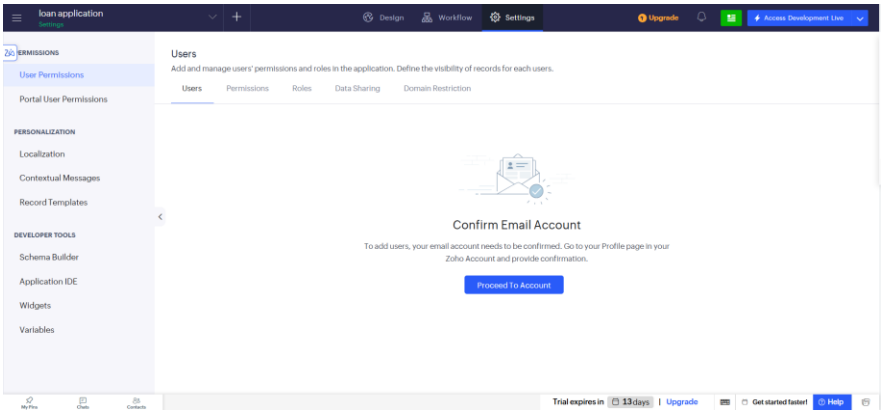

Role-Based Access Control (RBAC) assigns permissions to users according to their roles. It helps protect confidential information and ensures that users can access only the features they need.

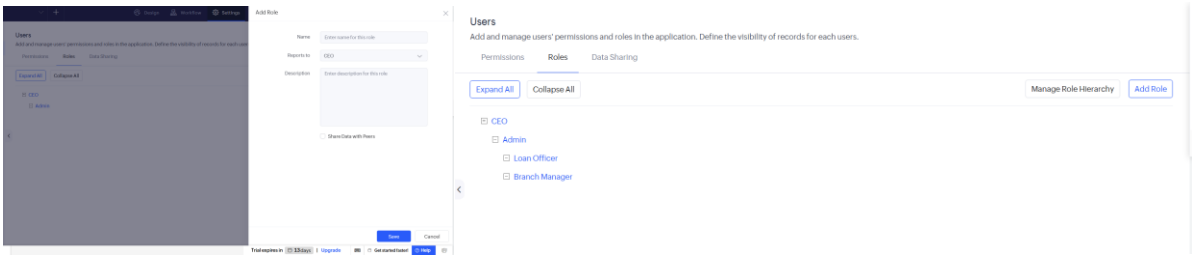

The proposed roles are:

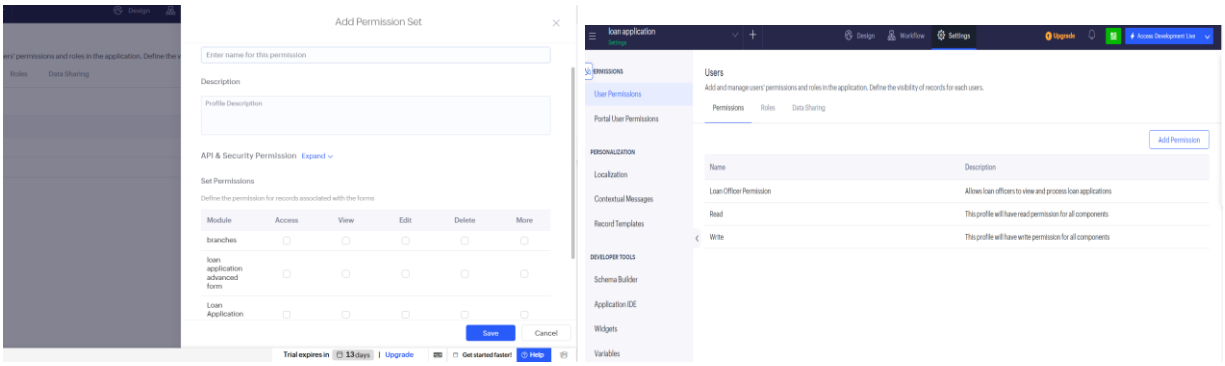

Role	Responsibilities
Admin	Manage application settings, users and permissions.
Loan Officer	View and process loan applications according to assigned permissions.
Branch Manager	Review applications and reports permitted for their branch.

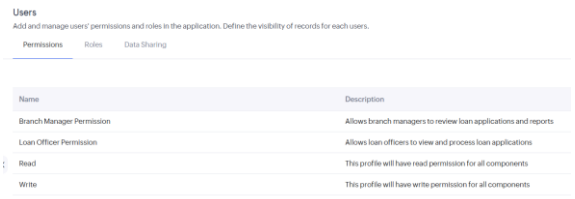

Procedure

1. Open the application settings.
2. Locate the Users, Permissions or Roles section.
3. Review the available roles and permission options.
4. Configure or inspect permissions for the required roles, depending on account access.
5. Verify access using the available user-management features.

Result

The concepts of user management and role-based access control were studied for the loan application system.
