Experiment 9 — AI and Analytics Using Zia

Aim

To explore Zia AI capabilities and analytics features in Zoho Creator for analysing loan application data.

Theory

Zia is Zoho's AI assistant and intelligence technology. Depending on the product, plan and account configuration, it can provide AI-assisted insights and other intelligent features.

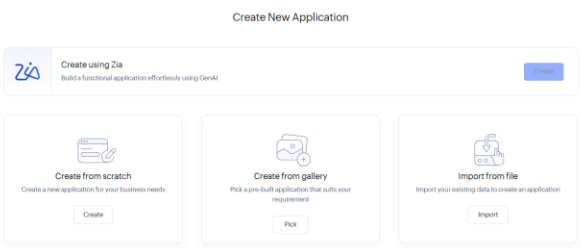

For a loan application system, useful analytics include:

- Number of applications by loan type.
- Distribution of applications by status.
- Total requested loan amount.
- Comparison of applications across branches.

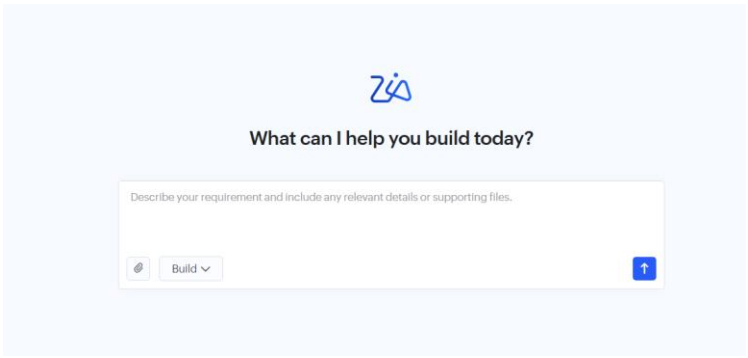

Ordinary reports and charts are useful analytics, but they should not automatically be described as AI-generated results.

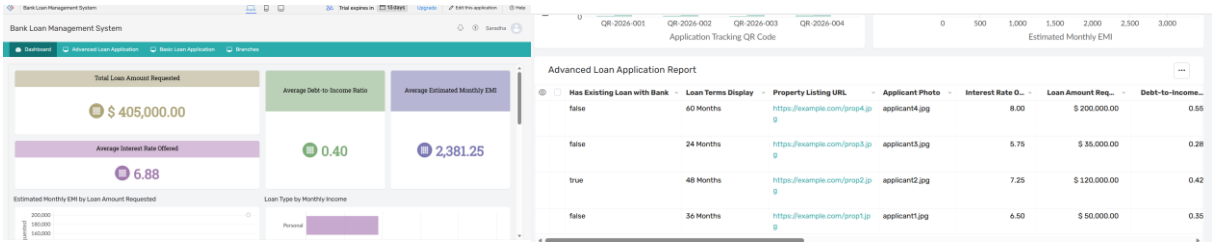

Procedure

1. Open the loan application application in Zoho Creator.
2. Inspect the available Zia or AI features.
3. Open the reports section.
4. Identify available fields such as loan type, application status and requested amount.
5. Review or create charts and summaries if the account permits.
6. Record which features are available in your account.

Result

Zia and the available analytics features were explored for potential use in loan application analysis.
